Off-line filter/cooler unit FGSL

Coolers are used to stabilise the operating temperature in hydraulic and lubrication systems. This can be implemented particularly cost-efficiently by integrating the cooler in a bypass circuit. The required cooler size can be calculated much more accurately if the flow rate and cooling capacity specifications are definite. At the same time, the bypass circuit can also be used to integrate the working filter. The stable recirculated volumes and low system pressure allow the use of less expensive filter housings. Another advantage is easier maintenance. The filter element can be replaced without shutting down the entire system.

The compact design of Bühler FGSL off-line filter units meet the requirements in application quite well and can also easily be retrofit in existing systems.

- Easy to maintain design
- Compact design
- Low noise emission
- Rugged cooling matrix
- Extensive accessories
- High suction pump
- Easy to integrate in existing systems
- Low pressure filter with a wide separation range and filtration capacity

Introduction and description

Why coolers?

In many cases, installing an off-line cooler is not only an emergency solution, but often the best solution with respect to mechanics and economics. Off-line filtration can usually also be incorporated quite effectively.

Since a bypass also always requires installing a separate circulation pump, it's reasonable to connect it to the existing fan motor.

The FGSL series is a tiered line of oil/air coolers with directly flange-mounted circulation pump. The cooler size and pump flow rate are coordinated for performance grades compatible with the system. The gerotor pump ensures the entire unit is emits very little noise.

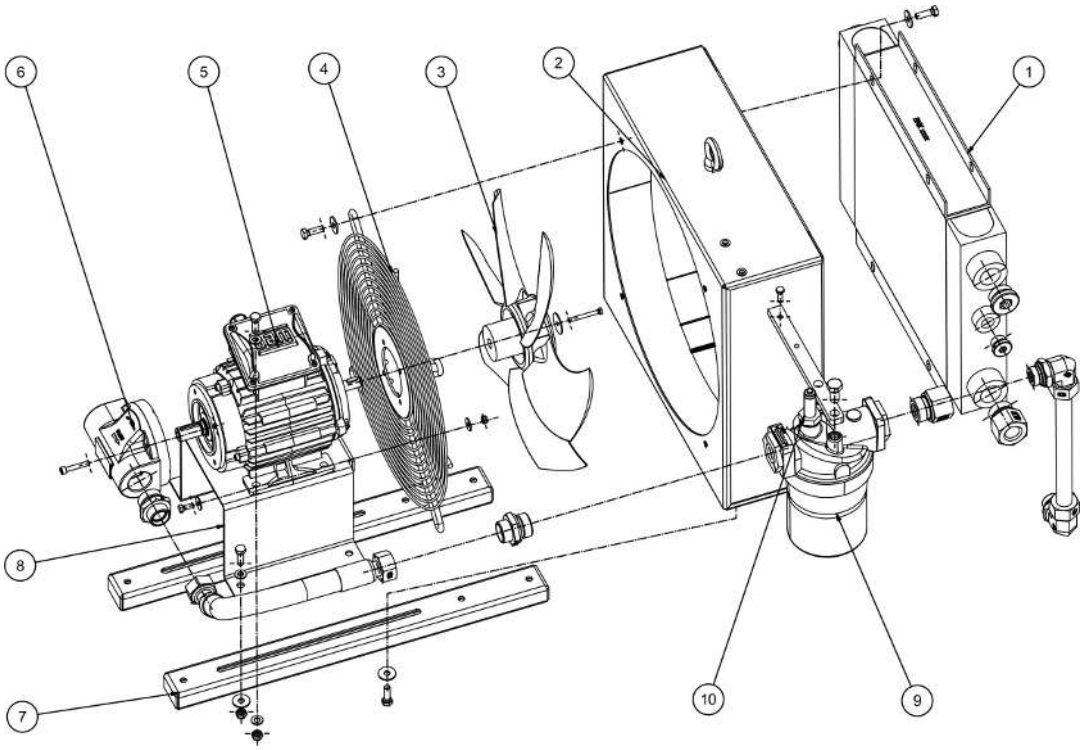
Why Bühler?

When we developed the BNK series, we incorporated our years of experience in designing and selling oil/air coolers and combined units. Especially the fatigue life of the cooling matrix was a focus during development.

The cooling matrix can easily be removed from the fan case for maintenance without removing the fan or motor.

If our comprehensive standard range of products does not include the right solution for your application, we will gladly find a solution specific to your needs.

Use the data in this leaflet to find a unit suitable for your application.



Construction and application

The FGSL's consist of the following components:

- cooling matrix (1),
- fan case (2) with mounting rails (7),
- blower and pump unit consisting of three-phase motor (5), pump (6), fan (3), protective/mounting grate (4) and motor bracket (8),
- attached low pressure filter (9) with built-in bypass valve and mechanical/ visual contamination indicator (10).

The cooling matrix and fan/pump unit can be removed from the fan case individually without having to remove other components.

The cooling matrixes in the FGSL series are aluminium. The coolers are designed for use in hydraulic circuits.

Filtration

We offer a wide range of filter elements to use in the filter housing. Contact us for an in-depth consultation.

Equipment Expansion (upon request)

We also offer cooling matrix versions with internal or external bypass and upgrades with various sensors. For example pressure gauge, pressure transmitter 4-20 mA, pressure switch, thermometer and temperature transmitter 4-20 mA, temperature switch, flow switch, flow meter, particle counters.

Various electric switches can be added to indicate the filter contamination level.

Device Modification (upon request)

- different RAL paint colour up to corrosion-protection class C5 ISO 12944,
- motor equipment, different IP rating, different voltage, approvals from licensing institutions,
- special sizes with different dimensions,
- Modification for installation in altitudes over 1000 m and different ambient temperatures.

Planning information

Set-up

The unit must be set up so the air supply and exhaust will not be obstructed. The clearance to air obstacles at the front and back of the cooler should be at least half the cooler height (dimension B).

Ensure adequate ventilation. When installing the unit, be sure the warm exhaust air or noise emitted will not cause problems.

If the ambient air is dirty, excess deposit on the cooling matrix must be expected. This will reduce the cooling capacity. In this case, particularly in the case of air loaded with oil mist, the air ducts must be cleaned regularly.

For outdoor installation, ensure the motor is adequately protected from the weather.

Ensure easy access for inspection and maintenance.

Mounting

The units secure to the mounting rails with four screws. Be sure the support structure is sized adequately. Install in any position.

Connecting the oil circuit

The connection between the system and the cooling matrix should be stress and vibration free, which can be achieved by using conduit.

Follow the relevant safety regulations to prevent environmental damage due to potential oil leaks (e.g. collection pans).

Technical data

Technical Data	
Materials / surface protection	
Cooling matrix: ventilation box, safety guard and motor brackets: Pump:	painted aluminium plastic-coated steel anodised aluminium, sintered steel
Colour:	RAL 7001
Filter housing:	aluminium die casting, passivated, unpainted
Operating fluids:	Mineral oils per DIN 51524 Gear oil per DIN 51517-3
Operating pressure, static:	16/29/42 L/min – max. 6 bar 58/88 L/min – max. 8 bar
Suction pressure:	max. -0.4 bar/-0.6 bar temporarily
Operating oil temperature:	max. 80 °C (higher upon request)
max. viscosity:	100 cSt medium viscosity (higher upon request)
Ambient temperature:	-15 to +40 °C
max. altitude:	1000 m ASL (higher upon request)
Filter series:	Filtration Group PI 200
Visual contamination indicator switching point:	Δ P 2.2 bar +/-10 %
Filter bypass valve opening pressure:	Δ P 3.5 bar +/-10%
Available filter fineness:	3 – 100 µm
Seals:	NBR

Electric motors (others available upon request)	
Voltage/frequency:	220/380V – 230/400V – 240/415V 50Hz 460 60 Hz
Thermal stability:	Insulation class F, utilisation per Class B
IP rating:	IP55

The motors comply with standard IEC 60034. Electric per NEMA, with UL/CSA/EAC approval.

Model key

FGSL 30 / PI 2015-57 / BNK 2.4-30-0.75kW-IBx / 7680358 / 99

- Pump output per litre
- Filter housing, see section "Filter Elements"
- **57** mechanical contamination indicator (standard)
  58 electric top for contamination indicator
  NO contact/NC contact
- see BNK data sheet no. 360001:
  - Frame size
  - Number of motor contacts
  - Pump output per litre
  - Motor power
- **AB** external bypass / **x** Bypass value 2 bar, 5 bar, 8 bar
  IB internal bypass / **x** Bypass value 2 bar, 5 bar, 8 bar
  ITB internal temperature-dependent bypass 2 bar / 45 °C
  ATB external temperature-dependent bypass 2 bar / 45 °C
- Filter element, see section "Filter Elements"
- Expansion and modification per section "Equipment Expansion"

Basic Data Standard Models (for 50 Hz frequency)

The standard model includes the installed filter housing with mechanical contamination indicator, without filter element.

**DIN EN ISO 3744, Class 3, when operated at 60 Hz +3 dB

Filter Accessories

Filter elements

PS fibreglass filters are suitable for low viscosity oils and have a high dirt capacity.

DRG wire mesh filter elements DRG are suitable for high viscosity motor and gear oils and have a low dirt capacity. They are more expensive than type PS, but can be cleaned.

Item no.	Description
77536550	Electric top for contamination indicator NO/NC contact

Calculation example and nomenclature

$t_{ÖE}$ [°C]	Inlet oil temperature
t_{LE} [°C]	Inlet air temperature
ETD [K]	Temperature differential: **ETD = $t_{ÖE}$ - t_{LE}**
P_{spez} [kW / K]	specific cooling performance (see performance curves): **P_{spez} = P / ETD**
P [kW]	Cooling performance in kW
Q [l/min]	Oil flow rate
$C_{Öl}$ [kJ/kgK]	Specific heat capacity of the oil (approx. 2.0 kJ / kgK)
ς [kg/dm³]	Gravity of oil ≈ 0.9 kg/dm³

Calculation example

Assumptions:

Tank capacity	**(V)**	approx. 200 L
Start up temperature of oil	**(T_1)**	15 °C (≈ 288 K)
Oil heats up in approx. t = 25 min. (1500 s) to	**(T_2)**	45 °C (≈ 318 K)
Required oil temperature	**($t_{ÖE}$)**	60 °C
Inlet air temperature	**(t_{LE})**	30 °C

Calculation:

1. Calculating P from the tank warming

$$P = \frac{V \cdot \varsigma \cdot c_{Oil} (T_2 - T_1)}{t} = \frac{200\ \text{l} \cdot 0.9\ \frac{\text{kg}}{\text{l}} \cdot 2\ \frac{\text{kJ}}{\text{kg} \cdot \text{K}} \cdot (318\ \text{K} - 288\ \text{K})}{1500\ \text{s}} = 7.2\ \text{kW}$$

2. ETD = $t_{ÖE}$ - t_{LE} = 60 °C - 30 °C = 30 K
3. Determining the cooler size: P_{spez} = P / ETD = 7.2 kW / 30 K = 0.24 kW/K
4. Select a cooler from the basic data with P_{spez} 0.24 kW/K. There is one option: BNK 3.4 with 30 L pump

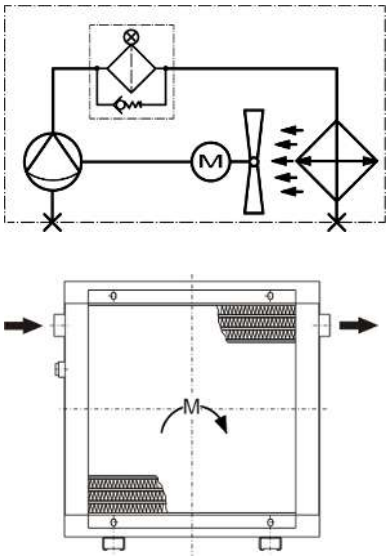
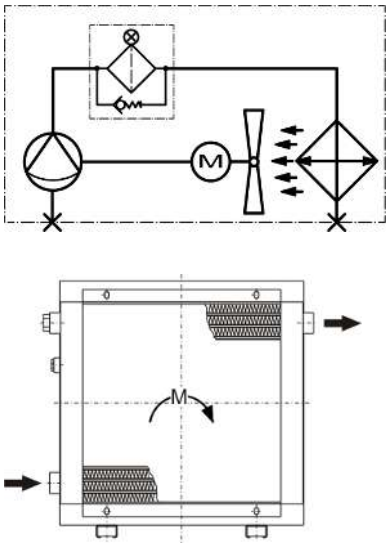
Functional diagram

Standard version BNK 2



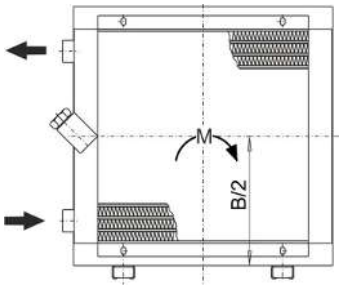
The oil inlet is on the left of the cooling matrix. The oil outlet is always on the opposite side.

Standard version BNK 3 to BNK 6



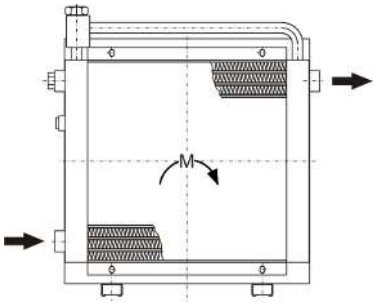
The oil inlet is on the bottom left of the cooling matrix. The second connection at the top must be closed. The oil outlet is always on the opposite side.

Internal bypass IB/ ITB (BNK 3-6)



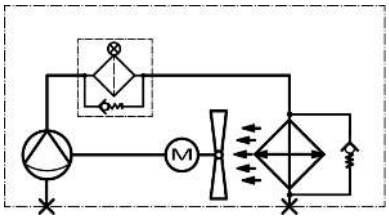
The oil inlet and outlet is always on the same side of the cooling matrix. The connection on the opposite side must be closed.

External bypass AB/ATB (BNK 2-6)



The oil inlet is always at the bottom left of the cooling matrix. The second connection must be closed. The oil outlet is always on the opposite side.

With bypass valve



With temperature-dependent bypass valve
