

Sample gas cooler EGK 1 Ex2

In the chemical industry, petrochemistry or biochemistry, reliable process control relies on prompt and exact determination of the operating parameters.

Here, gas analysis is the key for safe and efficient control of process flows, environmental protection and quality assurance. This benefits controlling flue gas emission in power stations or exhaust gas analysis in automotive engineering, as well as the efficient control of air separators or sterile production and packaging in the food industry.

Many of the analysis processes used in these fields require extracting the sample gas. This inevitably also extracts process-related contamination such as particles or moisture. These in turn can impact the measurement results or damage the measuring cells. The sample gas must therefore be conditioned before entering the analyser.

The EGK 1 Ex2 compressor sample gas cooler is ATEX, IECEx and EAC Ex approved and is suitable for operation in explosive zones with up to 2 gas paths.

Ex approved Zone 2

EAC Ex approval

Compact installation

One or two gas paths

Heat exchanger made from stainless steel, Duran glass and PVDF

Bühler constant control system

Self-monitoring

Block temperature display

Status alarm

Rated cooling power 303 Btu/h

Dew point stability 0.2 °F

CFC-free

Please note for this device:

The equipment must be installed in a housing which at a minimum meets EPL Gc.

Performance data

Remark: The limit curves for the heat exchangers exchanger apply to a dew point of 149 °F.

Heat exchanger description

The energy content of the sample gas and the required cooling capacity of the gas cooler is determined by three parameters: gas temperature ϑ_G , (inlet) dew point τ_e (moisture content) and volume flow v . The outlet dew point rises with increasing energy content of the gas. The approved energy load from the gas is therefore determined by the tolerated rise in the dew point.

The following limits are specified for a normal standard operating point of $\tau_e = 149\text{ °F}$ and $\vartheta_G = 194\text{ °F}$. The maximum volume flow v_{\max} in NI/h of cooled air is indicated, so after moisture has condensed.

If the values fall below τ_e and ϑ_G , the flow v_{\max} may be increased. For example, on the TG heat exchanger the parameter triple $\tau_e = 149\text{ °F}$, $\vartheta_G = 194\text{ °F}$ and $v = 4.7\text{ lpm}$ may also be used in place of $\tau_e = 122\text{ °F}$, $\vartheta_G = 176\text{ °F}$ and $v = 6.3\text{ lpm}$.
